1. VS-Code

Assignment Notes
1. Why it is called React
2. Emmet -- Web developer features in VS Code. Helps like an IntelliSense for HTML and CSS.
3. Why script tag is always at the end of HTML body -- script blocks additional resources to get downloaded quickly. So for better performance, it is put at the bottom to get the style, content, and media attributes download faster.
4. CDN - Content delivery network -- A got it covered from https://dev.to/akhilpokle/what-are-cdn-and-how-do-they-work-1n3g
5. Async and Defer --

6. Arrow functions - Are same as functions with some limitations
    Arrow functions don't have their own bindings to this, arguments, or super, and should not be used as methods.
    Arrow functions cannot be used as constructors. Calling them with new throws a TypeError. They also don't have access to the new target keyword.
    Arrow functions cannot use yield within their body and cannot be created as generator functions.
